

Anuar Beibit

Senior Frontend Engineer · AI & Agent Interfaces

2.5 MB → 650 KB · SSR incidents ÷4 · feature velocity +120% · 11.6k lines of React 19 in a live agent platform

+7 (707) 911-69-92 anoirsmail@gmail.com [Linkedin.com](#) Almaty, Kazakhstan [Personal page](#)

AI & AGENT INTERFACES

Autonomous multi-agent coding platform - self-hosted fork of OpenHands - my primary development environment, used daily

2025 - PRESENT · 11.6k lines of React 19 across 142 files · 387 commits ahead of upstream

- **Live agent-event streaming over WebSocket.** An agent's tool calls, file edits and terminal output render as they happen; Monaco and xterm panes read the same event log. State in Zustand, server cache in TanStack Query.
- **Lazy chat history.** Replaced full WebSocket replay with REST pagination plus tail-only replay — long conversations stopped re-streaming their entire history on open.
- **Sub-agent editor on a transport abstraction.** One UI drives either a live sandbox or a plain host folder, so agent roles can be edited before any container exists.
- **Shipped the whole operator surface:** autonomy switcher, agent stop control, per-run task strip, git-worktree status badges, subscription usage widget, project dashboard and scheduled messages.
- **Kept the fork healthy.** Migrated to ESLint 9 flat config ahead of upstream, drove the suite fully green (2,400+ tests) after fixing MSW double-interception and an env leak into Vitest, and enforced translation completeness across 15 locales in the pre-commit gate.
- **Backend under it:** FastAPI services for projects, scheduling, usage and git-worktree isolation per agent run; Docker sandboxes; deploy with zero public surface (Tailscale, Caddy, systemd, cron deploy with health check and auto-rollback).
- **Used technologies:** React 19, React Router 7, TypeScript, Zustand, TanStack Query, Tailwind 4, Vite, Vitest, Playwright, MSW, WebSocket, Monaco, xterm.js, i18next, Python, FastAPI, PostgreSQL, Redis, Docker.

CarCity, Mercury Properties - AI adoption across the engineering team

- **Taught the team to work with AI.** Ran internal lectures and hands-on sessions, then built the setup that made it stick day to day: editor plugins, custom MCP servers, a RAG index over the codebase and internal docs, and a local code graph for structural questions.
- **Made it NDA-safe.** Anonymized data before it reached any AI tooling, so client and business information never left in identifiable form — the precondition for using any of it under the company's NDA.
- **Stability was the payoff.** SSR incidents and emergency hotfixes dropped 4× in two months. CarCity's current stability is the output of that adoption, not a separate effort.

EXPERIENCE

MERCURY PROPERTIES - Senior Frontend Engineer, Almaty, Kazakhstan

May 2025 - PRESENT · Kazakhstan's largest commercial real-estate holding — 51+ properties, 1M+ m² under management

MercuryX - turnkey B2B platform for sourcing and importing from China (Halyk ecosystem)

- Rebuilt a barely viable MVP into a platform that scales: modular feature-based architecture, no more shipping the whole app up front — initial load 2.5 MB → 650 KB (~74%).
- Drove the Halyk Market integration end to end: hammered out the business logic with the backend team, curated product pricing and cost calculation, and kept every side of the feature moving — ownership well past the frontend brief.
- Shipped the commerce path end to end: authentication, cart, order flow, unit-tested.
- Set up the code-review system and automated the routine out of the developer workflow.

CarCity - auto-parts e-commerce marketplace

- Migrated the whole project from stock Nuxt to Feature-Sliced Design: less boilerplate, +120% feature velocity.
- Documented architecture, features and business logic — onboarding stopped running on tribal knowledge.
- **Used technologies:** Vue 3, Nuxt 3, Pinia, Vite, TypeScript, Tailwind CSS, Feature-Sliced Design, SSR, Docker.

SOLUTION ARCHITECTS - Full-Stack Software Engineer (contract), Remote (Astana, Kazakhstan)

September 2024 - February 2025

- Built reusable component libraries and centralized state (Pinia / Vuex), a multi-time-zone marketing calendar with its scheduling logic, and admin panels with the CI/CD that ships them.
- Delivered several MVPs with a team of senior engineers, owning architecture decisions and code review.
- Wired Jira to GitHub — linked environments, ticket → branch → PR, automated checks — and deleted the manual steps from the team's day.
- **Used technologies:** Vue 3, Pinia, Vite, TypeScript, Tailwind CSS, AWS, Docker, CI/CD, Jira, GitHub Actions.

POWR.IO - Full-Stack Software Engineer, Remote (Based San Francisco, CA)

July 2021 - August 2024

- Generated 1M+ localized landing pages in 12 languages from a programmatic pipeline: SEO rankings up, inbound engagement doubled.
- Built customizable plugins and dynamic UI in React — 40% lift in plugin sales.
- Moved image resizing to serverless — faster responses, smaller hosting bill.
- Built the integration system that automated chat notifications, ticket updates and CI/CD docs.
- Mentored mid and junior engineers in a fully remote US team across a 12-hour time difference.
- **Used technologies:** React, Next.js, Node.js, Ruby on Rails, Redis, Docker, SEO, Bash and Linux.

NCRM GROUP - Front-end Engineer (Angular), Almaty, Kazakhstan

June 2020 - July 2021

- Built the front-end infrastructure and prototype for a CRM now used by 2,000+ employees.
- Integrated WhatsApp and Telegram into the CRM via custom APIs; standardized practices and wrote the docs.
- **Used technologies:** Angular 10, Vue.js, Vite, Jasmine.js, Docker and OpenVpn.

January 2020 - June 2020 - **Project Manager**

- Led the CRM sales-conversion and productivity statistics module, now used by 50+ companies.

PROJECTS

WoCards.app - CTO, Almaty, Kazakhstan

December 2022 - April 2023 · MVP mobile app for learning English by a flashcard system

- Led a small team, chose the stack, set up CI/CD. Used technologies: Node.js, Flutter, React Native, Linux.

KEY SKILLS & TECHNOLOGIES

AI & Agents: LLM application engineering, agent UI and streaming UX, multi-agent orchestration, sub-agent delegation and role design, MCP (Model Context Protocol) server development, RAG and code-graph indexing, tool and function calling, agent sandboxing, LiteLLM multi-provider routing, prompt and system-prompt design, token and cost optimization, automated verification gates, data anonymization for NDA compliance, AI enablement and developer training, Anthropic and OpenAI APIs, ComfyUI pipelines

Frontend: Vue 3, Nuxt 3, React 19, Next.js, React Router, Angular, TypeScript, JavaScript (ES6+), HTML5, CSS3, Pinia, Vuex, Redux, Zustand, TanStack Query, Tailwind CSS, Sass, Less, Vite, Webpack, Babel, SPA, SSR, SSG, PWA, Feature-Sliced Design, design systems, component libraries, real-time and streaming UIs (WebSocket, SSE), Monaco, xterm.js, responsive and cross-browser layout, accessibility, i18n

Performance & Quality: Code splitting, lazy loading, tree shaking, bundle analysis, Core Web Vitals, caching strategies, image optimization, Vitest, Jest, Jasmine, Playwright, MSW, unit and component testing, TDD, code review, profiling, debugging, ESLint flat config, pre-commit gates

Backend & Data: Node.js, NestJS, Express, Fastify, TypeScript, REST, GraphQL, WebSockets, gRPC, PostgreSQL, MySQL, MongoDB, Redis, Prisma, TypeORM, schema design, indexing, API design, OAuth2, RBAC, microservices, Clean Architecture, DDD

Cloud & Process: Docker, AWS (Lambda, EC2, S3, RDS), Nginx, Caddy, systemd, Linux, Bash, CI/CD (GitHub Actions, GitLab CI), Git flow, Jira, Agile / Scrum, technical documentation, architecture docs, mentoring, remote collaboration, cross-functional ownership

EDUCATION

September 2018 - June 2022

SULEYMAN DEMIREL UNIVERSITY, Kaskelen, Kazakhstan - *B.S. Information and Communication Technologies*
