AI & AGENT INFRASTRUCTURE

Autonomous multi-agent coding platform - *self-hosted fork of OpenHands - my primary development environment, used daily*

2025 - PRESENT · 387 commits ahead of upstream · ~16k lines of application code

- **Role-based multi-agent delegation.** Planner / coder / tester / reviewer sub-agents, each on its own LLM profile with its own tool set and budget — one task fans out across models (Opus plans, Sonnet workers) and reconverges. Proved end to end on a real task: 24/24 tests green.
- **Real-time agent UI.** 11.6k lines of React 19 across 142 files: live agent-event streaming over WebSocket, Monaco and xterm panes, a sub-agent editor that works against a live sandbox or a plain host folder, lazy chat history. 15 locales, 2,400+ tests green.
- **Isolation per agent run.** Docker sandbox plus a dedicated git worktree per conversation, merge-back with a merged/unmerged guard that survives a paused sandbox, and a GC that reaps orphaned containers, branches and stale images.
- **Self-improving loop.** The agent clones the repo, picks the next backlog item, implements it, and is only allowed to push if an automated gate passes — typecheck, ESLint, Ruff and pytest. First agent-authored PR merged to main.
- **Cost engineering.** OAuth proxy routes agent traffic through a Claude subscription instead of per-token API keys, with hybrid fallback to any LiteLLM provider; a prebuilt local code graph replaced grep-walking for structural questions — 13.6× cheaper recon.
- **Shipped with zero public surface.** Tailscale-only access, Caddy and systemd, cron deploy with health check and automatic rollback on failure.
- **Used technologies:** Python 3.13, FastAPI, SQLAlchemy (async), Alembic, PostgreSQL, Redis, LiteLLM, MCP, OpenTelemetry, React 19, React Router 7, TanStack Query, Zustand, Tailwind 4, Docker, Vitest, Playwright.

CarCity, Mercury Properties - *AI adoption across the engineering team*

- **Taught the team to work with AI.** Ran internal lectures and hands-on sessions, then built the setup that made it stick day to day: editor plugins, custom MCP servers, a RAG index over the codebase and internal docs, and a local code graph for structural questions.
- **Made it NDA-safe.** Anonymized data before it reached any AI tooling, so client and business information never left in identifiable form — the precondition for using any of it under the company's NDA.
- **Stability was the payoff.** SSR incidents and emergency hotfixes dropped 4× in two months. CarCity's current stability is the output of that adoption, not a separate effort.

EXPERIENCE

MERCURY PROPERTIES - *Senior Frontend Engineer, Almaty, Kazakhstan*

May 2025 - PRESENT · Kazakhstan's largest commercial real-estate holding — 51+ properties, 1M+ m² under management

MercuryX - *turnkey B2B platform for sourcing and importing from China (Halyk ecosystem)*

- Built the full Halyk Market integration, rewrote the business logic behind it, and owned product pricing and cost calculation across supplier price, logistics and customs — the numbers the entire import flow runs on.
- Rebuilt a barely viable MVP into a platform that scales: modular feature-based architecture, no more shipping the whole app up front — initial load 2.5 MB → 650 KB (−74%).
- Shipped the commerce path end to end: authentication, cart, order flow, unit-tested.
- Set up the code-review system and automated the routine out of the developer workflow.

CarCity - *auto-parts e-commerce marketplace*

- Migrated the whole project from stock Nuxt to Feature-Sliced Design: less boilerplate, +120% feature velocity.
- Documented architecture, features and business logic — onboarding stopped running on tribal knowledge.
- **Used technologies:** Vue 3, Nuxt 3, Pinia, Vite, TypeScript, Tailwind CSS, Feature-Sliced Design, SSR, Docker.

SOLUTION ARCHITECTS - *Full-Stack Software Engineer (contract), Remote (Astana, Kazakhstan)*

September 2024 - February 2025

- Wired Jira to GitHub — linked environments, ticket → branch → PR, automated checks — and deleted the manual steps from the team's day.
- Delivered several MVPs with a team of senior engineers: architecture, code review, data model and service layer through to UI.
- Built reusable component libraries and centralized state (Pinia / Vuex), admin panels on internal APIs, a multi-time-zone marketing calendar, and the CI/CD pipeline on AWS that ships them.
- **Used technologies:** Node.js, Vue 3, Pinia, TypeScript, AWS, Docker, CI/CD, Jira, GitHub Actions.

POWR.IO - *Full-Stack Software Engineer, Remote (Based San Francisco, CA)*

July 2021 - August 2024

- Generated 1M+ localized landing pages in 12 languages from a programmatic pipeline: SEO rankings up, inbound engagement doubled.
- Built customizable plugins and dynamic UI in React — 40% lift in plugin sales.
- Moved image resizing to serverless — faster responses, smaller hosting bill.
- Built the integration system that automated chat notifications, ticket updates and CI/CD docs.
- Mentored mid and junior engineers in a fully remote US team across a 12-hour time difference.
- **Used technologies:** React, Next.js, Node.js, Ruby on Rails, Redis, Docker, SEO, Bash and Linux.

NCRM GROUP - *Front-end Engineer (Angular), Almaty, Kazakhstan*

June 2020 - July 2021

- Built the front-end infrastructure and prototype for a CRM now used by 2,000+ employees.
- Integrated WhatsApp and Telegram into the CRM via custom APIs; standardized practices and wrote the docs.
- **Used technologies:** Angular 10, Vue.js, Vite, Jasmine.js, Docker and OpenVpn.

January 2020 - June 2020 - ***Project Manager***

- Led the CRM sales-conversion and productivity statistics module, now used by 50+ companies.

PROJECTS

WoCards.app - CTO, Almaty, Kazakhstan

December 2022 - April 2023 · MVP mobile app for learning English by a flashcard system

- Led a small team, chose the stack, set up CI/CD. Used technologies: Node.js, Flutter, React Native, Linux.

KEY SKILLS & TECHNOLOGIES

AI & Agents: LLM application engineering, multi-agent orchestration, sub-agent delegation and role design, MCP (Model Context Protocol) server development, RAG and code-graph indexing, tool and function calling, agent sandboxing and isolation, LiteLLM multi-provider routing, prompt and system-prompt design, token and cost optimization, automated verification gates for agent output, data anonymization for NDA compliance, AI enablement and developer training, Anthropic and OpenAI APIs, ComfyUI pipelines

Backend & Architecture: Node.js, NestJS, Express, Fastify, Next.js (SSR), TypeScript, JavaScript (ES6+), REST, GraphQL, gRPC, WebSockets, serverless, Clean Architecture, DDD, CQRS, microservices, modular monoliths, API design, OAuth2, RBAC, rate limiting, caching, load balancing, fault tolerance

Frontend: Vue 3, Nuxt 3, React 19, Next.js, React Router, Angular, Pinia, Vuex, Redux, Zustand, TanStack Query, Vite, Webpack, Tailwind CSS, Sass, SPA, SSR, SSG, PWA, Feature-Sliced Design, design systems, component libraries, real-time and streaming UIs (WebSocket, SSE), Monaco, xterm.js, Core Web Vitals, code splitting, accessibility, i18n

Data & Messaging: PostgreSQL, MySQL, MongoDB, Redis, ClickHouse, Prisma, TypeORM, schema design, indexing, query optimization, replication, sharding, migrations, ACID, RabbitMQ, Redis Streams, SQS, ETL

Cloud, DevOps & Process: AWS (Lambda, EC2, S3, RDS), Docker, Docker Compose, Nginx, Caddy, systemd, Tailscale, CI/CD (GitHub Actions, GitLab CI), Linux, Bash, monitoring and logging (Prometheus, Grafana, ELK, OpenTelemetry), Vitest, Jest, Playwright, TDD, code review, Jira, Agile / Scrum, technical documentation, mentoring

EDUCATION

September 2018 - June 2022

SULEYMAN DEMIREL UNIVERSITY, Kaskelen, Kazakhstan - *B.S. Information and Communication Technologies*
